CERIS Panel 2: Advanced Security Measures for Urban Areas

Presenter: Dr. Denis Caleta

Company: Institute for
Corporative Security Studies (ICS)

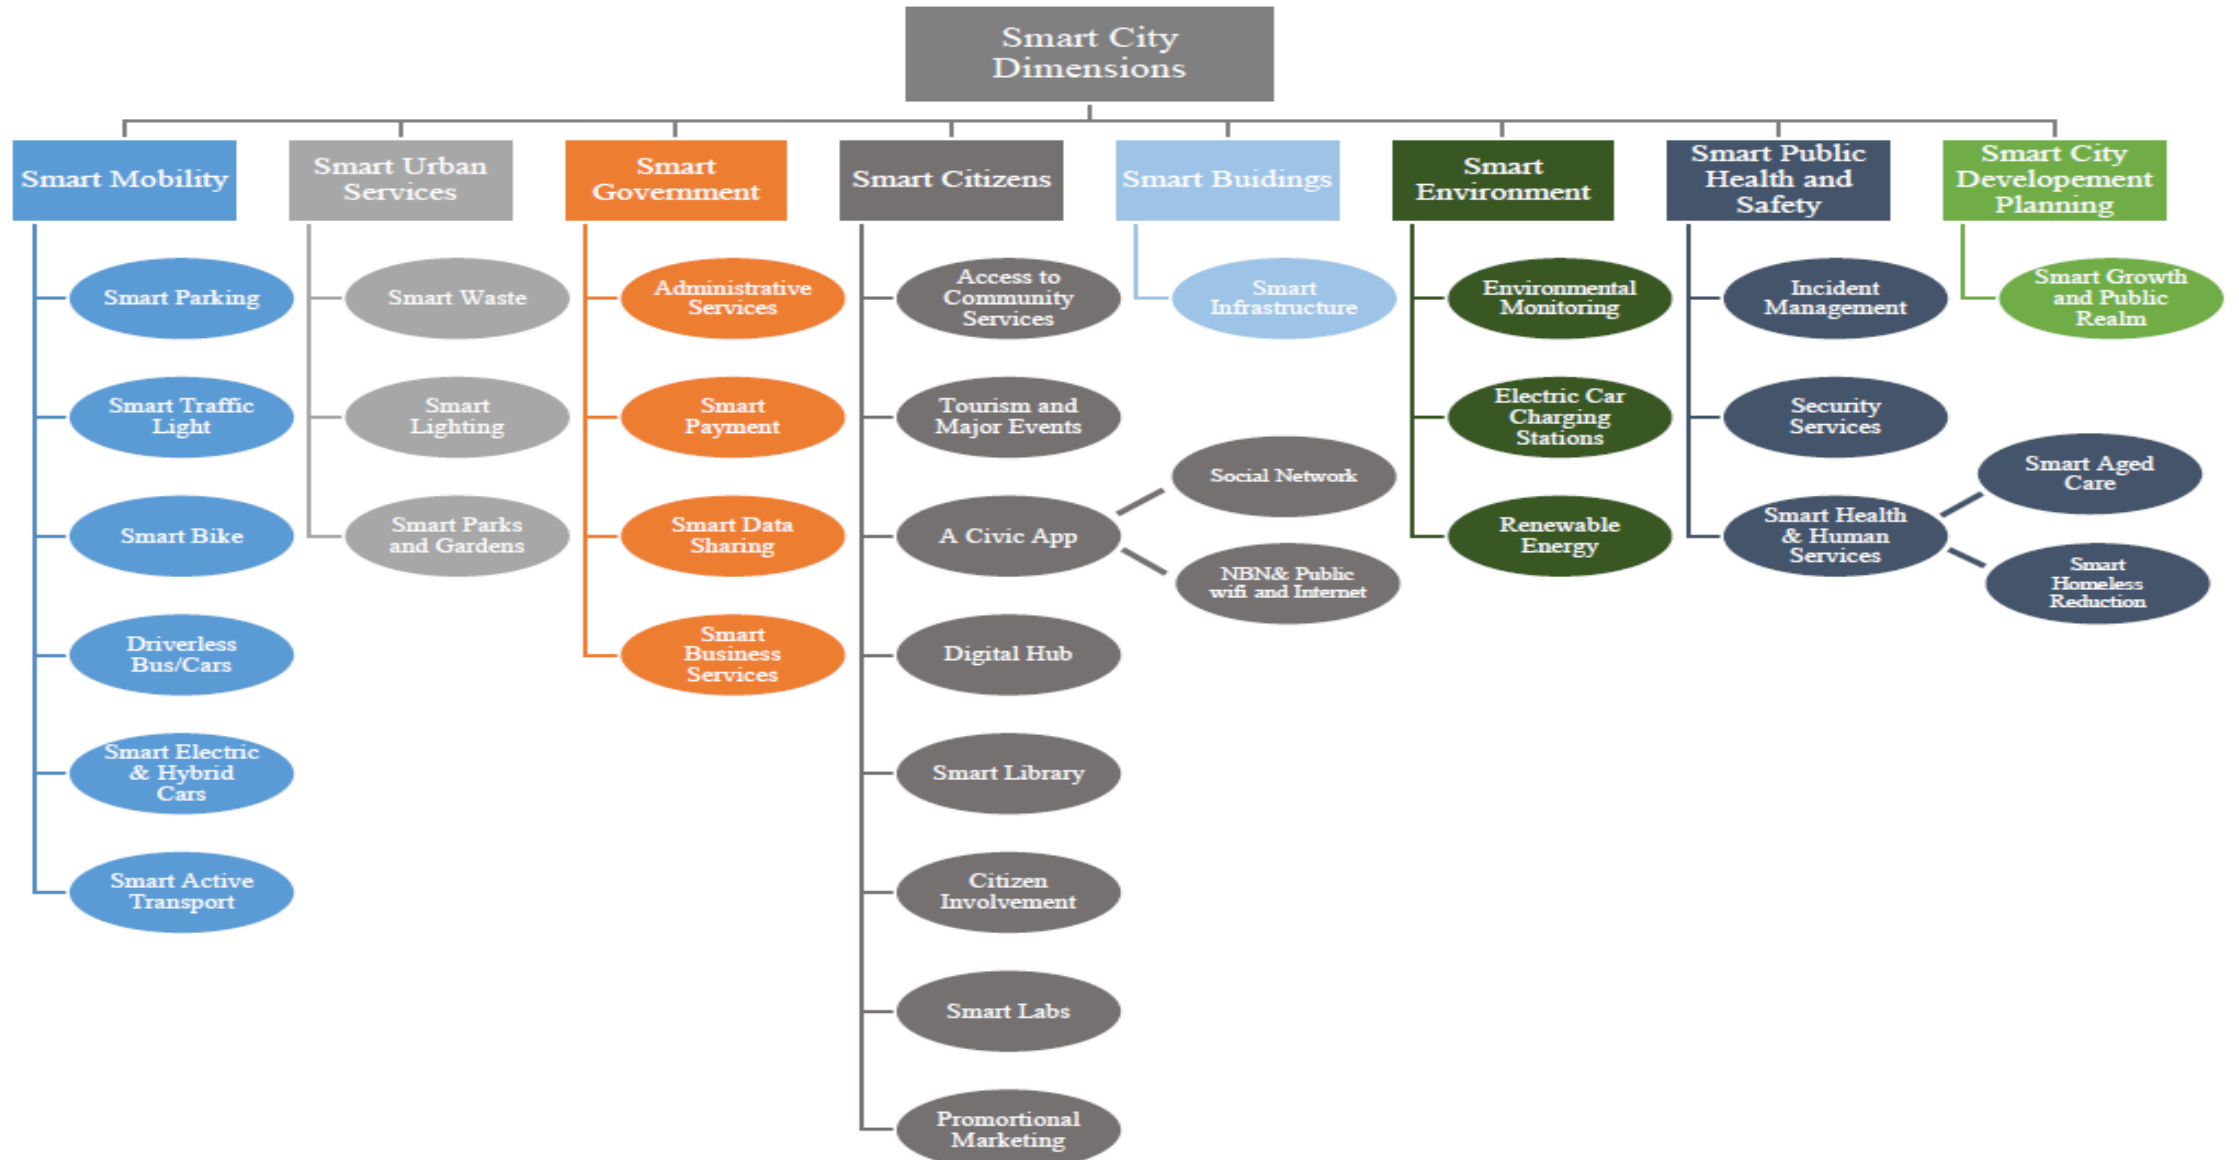

Date: 11th April 2024

Definition of Smart city solutions

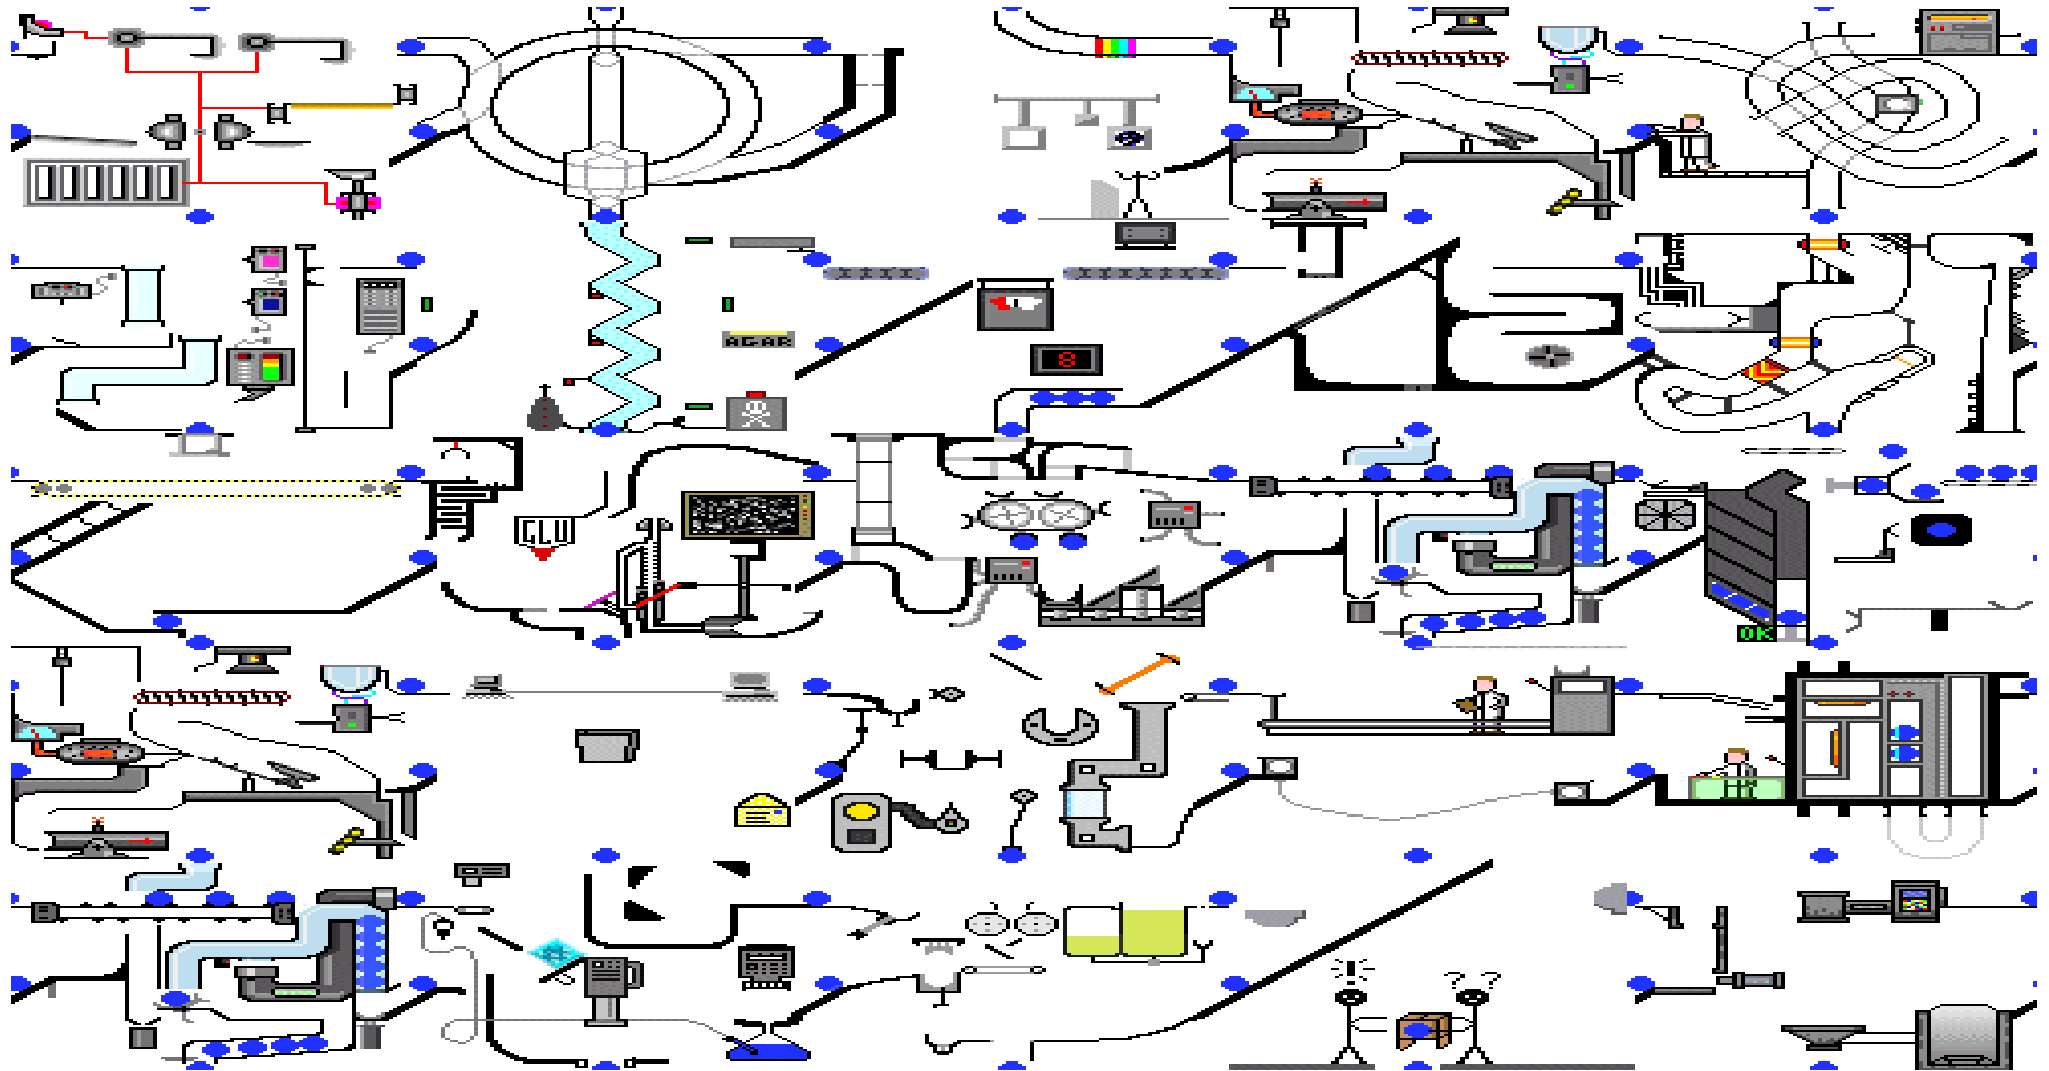

A city that secure use a technology to make life easier and better for its residents.

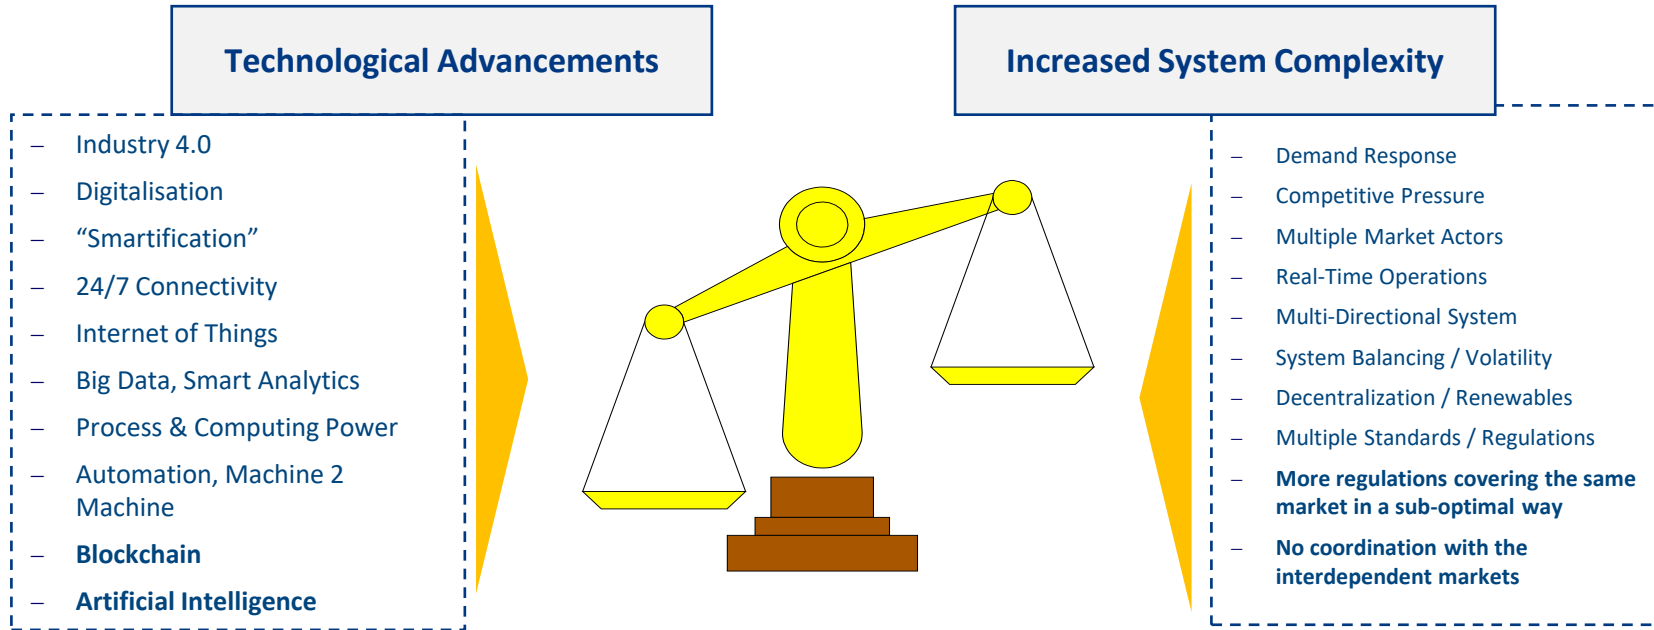

SMART CITY VERTICALS

Why is security understanding of this complexity so important?

THE MORE COMPLEX THE SYSTEM ARE THE MORE DEPENDENT THEY ARE ON THE WORKING OF ICT

New interdependencies and opportunities, but vulnerabilities as IT (Information Technology) and OT (Operational Technology) continue to converge and interoperate

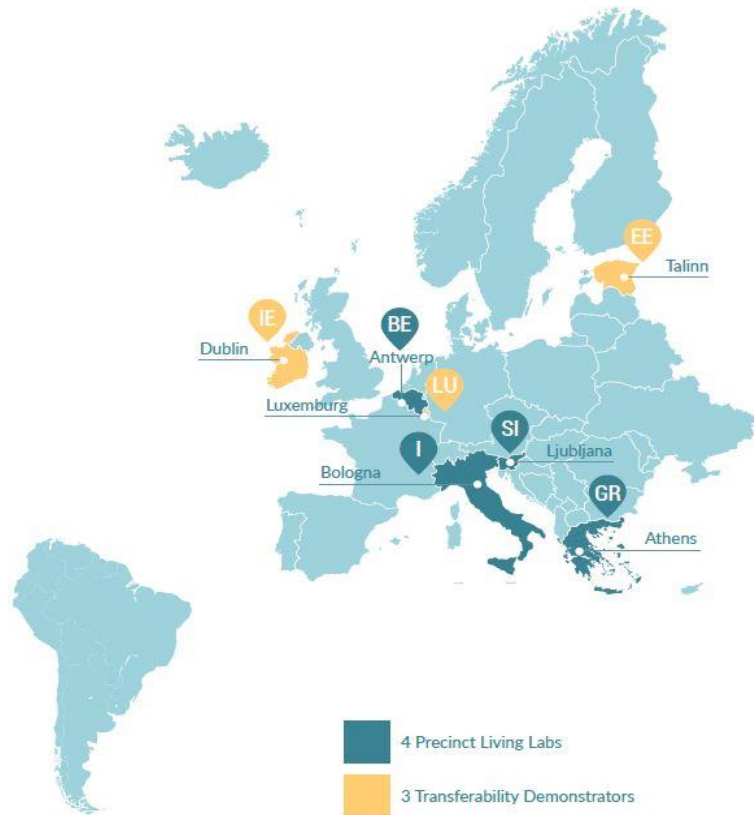

Identification of different levels of interdependencies and cascading effects in Smart City eco-system

- Identifying and analyse multiple levels of interdependencies and cascading effects as:
 - Combination of cyber and physical threats/hazards between the CI included in Smart City;
 - Analysis potential cascading effects (disaster escalation points);
 - Analysis element of risk (assets, installations, plants, employees, neighbouring populations, infrastructure, environmental qualities,....);
 - Analysis Disaster damage magnitude scale;
 - Analysis Scales for spatial and social effects from disaster scenarios under consideration.

Challenges with important influence on better resilience of operating smart cities

- Different level of integration and understanding jurisdiction (vertical, horizontal, processes);
- Lack of resources (personal, financial,.....);
- Vulnerability of ICT technologies which become a baseline for operating Smart City
 - Improved Cyber-Resilience of Industrial Networks and Cloud Data;
 - Enhanced Cybersecurity Measures for Smart City Technologies.
- Building security eco-system partnership (business continuity of CI operation = business continuity of operating Smart Cities)
- Important steps:
 - Raise strategic security awareness and level of expertise's for understanding complexity of system integration and improve of advance security measures;
 - Define clear powers and responsibilities for developing smart cities concept and systems;
 - Standardization security technologies and processes;
 - Proper managing with resources (avoiding siloes approaches);
 - Constant investing in research and development of technologies, methodologies and processes.

Discussion

Thank you for attention!
